STEPS IN CALCULATING EYE POSITION USING VIDEO OCULOGRAPHY

6/6

FIG. 6b

$$i = \sqrt{((\text{eye_radius_in_pixels})^2 - (j^2 + k^2))}$$

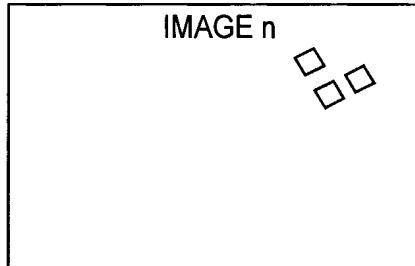

STEP 7

ONE IMAGE IS DEFINED AS THE REFERENCE IMAGE. FOR EXAMPLE "IMAGE 1" ABOVE. THE THREE-DIMENSIONAL COORDINATES OF EACH MARKER IN THIS IMAGE DEFINE THE REFERENCE OR ZERO POSITION OF THE MARKER ARRAY (AND EYE) AND ARE USED TO CONSTRUCT THE REFERENCE POSITION ROTATION MATRIX BELOW.

$$R = \begin{bmatrix} i_0 & i_1 & i_2 \\ j_0 & j_1 & j_2 \\ k_0 & k_1 & k_2 \end{bmatrix} \text{REFERENCE}$$

STEP8

THE THREE MARKERS IN EACH IMAGE ARE IDENTIFIED AS MARKER 0, MARKER1 OR MARKER 2. A LEAST SQUARES ALGORITHM IS USED TO ENSURE THAT EACH MARKER IS CORRECTLY IDENTIFIED AFTER TRANSIENT LOSS OF MARKER TRACKING.

STEP9

FOR EACH IMAGE THE THREE-DIMENSIONAL POSITION OF EACH MARKER IS CALCULATED AND USED TO CONSTRUCT A CURRENT POSITION ROTATION MATRIX .

$$R = \begin{bmatrix} i_0 & i_1 & i_2 \\ j_0 & j_1 & j_2 \\ k_0 & k_1 & k_2 \end{bmatrix} \text{CURRENT}$$

STEP 10

EYE POSITION (ROTATION MATRIX) IS DEFINED AS THE THREE-DIMENSIONAL ROTATION REQUIRED TO MOVE THE MARKER ARRAY (THREE MARKERS) FROM THE REFERENCE POSITION TO THE CURRENT POSITION.

STEP 11

$$R = \begin{bmatrix} i_0 & i_1 & i_2 \\ j_0 & j_1 & j_2 \\ k_0 & k_1 & k_2 \end{bmatrix} \text{CURRENT} * \begin{bmatrix} i_0 & i_1 & i_2 \\ j_0 & j_1 & j_2 \\ k_0 & k_1 & k_2 \end{bmatrix}^{-1} \text{REFERENCE}$$

EULER ANGLES, FICK ANGLES, HELIOHOLTZ ANGELES, ROTATION VECTORS OR QUATERNIONS CAN BE CALCULATED FROM THE EYE ROTATIONMATRIX TO DESCRIBE EYE POSITION.
